

North East Marina Update

After an on-site scoping meeting earlier this week between PFBC, DEP, and Department of General Services Job Order Contracting, it was determined that the lake water levels have risen to a point that a modified dredging approach should be sufficient to allow for boating activity in the marina basin this season. The dredging activity would primarily target the area where sediment accumulations are the most significant. DEP is agreeable to this approach with certain stipulations which the PFBC is currently working through. Due to the timing of receiving the cost estimate then procuring the dredging services, the docks are tentatively planned for installation in mid-April which will likely be prior to the dredging activity.

Additional information will be provided as the situation develops.
